

1  
2        **ABSTRACT**

3        An implementation of an improved Multiple-Original-Output  
4 ("Mopying") technology for multifunction devices (MFDs), described herein,  
5 enables a user at a computer to fully control and access the functions of a  
6 Mopy-enabled MFD. With this technology, the user fully controls the source  
7 (e.g. data and paper) for each Mopy of a Mopy job. Similarly, the user fully  
8 controls the destination (e.g. paper and communications) for each Mopy of a  
9 Mopy job. This abstract itself is not intended to limit the scope of this patent.  
10 The scope of the present invention is pointed out in the appending claims.
